Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

of of Nucleic acid encoding an inhibitor of apoptosis polypeptide - used inhibit apoptosis in e.g. HIV or AIDS patients, and for detection or susceptibility to apoptotic disease.

Claim 11; Page 78-79; 219pp; English.

Human xiap, hiap-1 and hiap-2 genes, and murine xiap, hiap-1 and hiap-2

```
ö
genes (AAT70836-41) respectively code for a new class of mammalian proteins (AAW19581-86) that are inhibitors of apoptosis (IAP). The murine xiap gene (for X-linked IAP gene) sequence was constructed from 12 overlapping clones isolated from a mouse embryo lambda-gtil obwa library and from a mouse embryo lambda-gtil obwa library and from a mouse PIX II genomic library using human xiap cDNA as probentap nuclea caides can be used to express IAP polypeptides in cells and animals to inhibit apoptosis, and as primers and probes to identify and isolate additional IAP genes, as well as in methods for treating diseases

The present sequence is a mouse IAP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          975
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GGAGGGCTCACGGATTGGAAGCCAAGTGAAGACCCCTGGGACCAGCATGCTAAGTGCTAC 180
                                                                               of
         The invention relates to an inhibitor of apoptosis (IAP) antisense nucleic acid (I) that inhibits IAP biological activity, regardless of length of the antisense nucleic acid, the IAP proteins may be mouse or human XIAP, HIAPI or HIAPI. Also included are a pharmaceutical composition comprising a mammalian IAP antisense molecule and a method enhancing apoptosis in a cell, comprising administering a negative regulator of the IAP anti-apoptotic pathway to the cell. The IAP antisense inhibitor is useful for enhancing apoptosis in a cell in a mammal diagnosed with a proliferative disease. The method is useful for treating a patient diagnosed with a proliferative disease like cancer. The IAP antisense molecule is useful to treat, ameliozate, improve,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            916 TATGAAGCACGGATCGTTACTTTTGGAACATGGATATACTCAGTTAACAAGGAGCAGCTT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         8
                                                                                                                                    This sequence encodes the mouse XIAP protein, which is a inhibitor of apoptosis protein (IAP), and can be used in the method of the invention. The method is for enhancing apoptosis in cells from a mammal with brolliferative disease by treatment with a compound that inhibits biological activity of an IAP or NAIP polypeptide. The inhibitory compounds are used to treat proliferative diseases, specially cancers of everty, breast, pancreas, lymph nodes, skin, blood, lung, brain, kidney, rectum, cervix or endometrium, particularly to increase their sensitivity to chemotherapeutic agents. High levels of the IAP or NAIP proteins are detected in many cancers and are associated with poor proteins are posisfance to chemotherapannic, arenes and minesting in the constant of the increase them.

                                                                                                                                                                                                                                                                                                                                                                             The present sequence is that of cDNA encoding murine inhibitor of apoptosis protein MIAP3. The invention provides a nucleic acid, such as an antisense oligonucleotide, which specifically hybridises to a nucleic acid encoding an inhibitor of apoptosis protein, especially MIAP1, MIAP2, MIAP3, CIAP1, CIAP2 and XIAP. A claimed method for inducing a cell's conditions contacting the cell with the nucleic acid under use of a vector, liposome, or a mechanical or electrical means. The use of a vector, liposome, or a mechanical or electrical means. The nethod is used to treat acute lymphocytic leukaemia, acute myelogenous leukaemia, lung cancer, breast cancer, ovarian cancer, prostate cancer, lymphoma, Hodgkin's disease, malignant melanoma, neuroblastoma, renal cell carcinoma and squamous cell carcinoma (all claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120

(I) is useful for identifying a compound that modulates TIAP biological activity (I) is useful for increasing apoptosis in a cell, preferably a germ-line cell and for increasing fertility in an animal. (I) is useful for treating or preventing apoptosis which occurs as a part of testicular cancer and male infertility. TIAP may be manipulated for use as a male bith control. ITAP polypeptides and nucleic acid sequences also have diagnostic use in the detection or monitoring of conditions involving aberrant levels of apoptosis. The present sequence represents the coding sequence of X-linked inhibitor of apoptosis (XIAP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GGAGGGCTCACGGATTGGAAGCCAAGTGAAGACCCCTGGGACCAGCATGCTAAGTGCTAC 180

It was isolated from a mouse liver CDNA library on the basis of homology to Orgyia pseudotsuguta polyhedrosis virus IAP BIR and RING finger amino acid motifs. Animal IAP homologue nucleic acids (see also AAT72711-17) can be used to produce polyhedricals useful in methods for modulating apoptosis in animal cells, specifically for treatment, by inhibition, of degenerative and infectious disease or, by promotion, of cancer and autoimmune disease, and can be used for gene therapy of these diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GGAGGGCTCACGGATTGGAAGCCAAGTGAAGACCCCTGGGACCAGCATGCTAAGTGCTAC 180
                                                                                                                                                                                                                                                                                                                                                                           Isolated protein homologues of viral inhibitors of apoptosis - used to modulate apoptosis for treatment of degenerative, infectious or auto:immune diseases and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1061 GCAAGAGCTGGATTTTATGCTTTAGGTGAAGGCGATAAAGTGAAGTGCTTTCACTGTGGA

Homo sapiens

Human signalling pathway polynucleotide probe SEQ ID NO 1053

```
This sequence encodes the human XIAP protein. The invention relates to a method for screening a substance inhibiting the formation of a complex between XIAP and TAB1, in which X-linked inhibitor of apoptosis protein (XIAP), transforming growth factor-beta activated kinase 1(TAK1) binding protein 1(TAB1) and a substance to be tested are contacted with each
                                             Human; TAB1; XIAP; X-linked inhibitor of apoptosis protein; TGF-beta; transforming growth factor-beta activated kinase 1; monocyte migration; TAK1 binding protein 1; extracellular matrix protein production; cell growth inhibitor; beta-amyloid protein deposition; immunosuppression; Transforming growth factor-beta; ds.
                                                                                                                                                                                                                                                                                                                                               Screening a substance which inhibits combination of the X-linked inhibitor of apoptosis protein.

The invention relates to a combination which, comprises a number of polynucleotide probes comprising a sequence selected from one of the 1490 sequences mentioned in the specification. The combination is useful as an array element in a microarray for monitoring the expression of a number of caray element in a microarray is particularly useful in the diagnostics and immunopathology and neuropathology. The microarray is useful in diagnostics and treatment regimens, drug discovery and development, toxicological and carcinogenicity studies, corensics and pharmacogenomics. The microarray is also useful for profiles for the effects of currently available therapeutic drugs. The compination is also useful for purifying a subpopulation of mRNAs, cDNAs and genomic fragments and in research and diagnostic applications. The array can detect changes in expression in a large number of genes coding to different signaling pathway populations which can be used to diagnose various diseases including cancer e.g. adenocarcinoma and leukaemia, immunopathies e.g. AlDS and asthma, neuropathies e.g. Alzheimer's disease companiations. Si diseases including pathway populations which can be used to diagnose to probe of the invention. Note: The sequence represents a polynucleotide probe of the invention. Note: The sequence data for this patent did not companiate directly from USPTO at Committee of the printed specification but was obtained in electronic constant and received the printed specification but was obtained in electronic constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant and constant an

The invention relates to a composition of polynucleotide probes comprising first polynucleotide probes comprising at least a portion of a gene encoding a receptor-like polypeptide, second polynucleotide probes comprising at least a portion of a gene encoding at transducing comprising at least a portion of a gene encoding an effector-like polypeptide. The probes of the composition are useful as array elements in a microarray for monitoring the expression of target polynucleotides. The microarray for monitoring the expression of target polynucleotides. The microarray is useful in the control of cancer, an immunopathology or a nalso be used for drug discovery and development, toxicological and carcinogenicity studies, forensics or pharmacogenomics. Microarrays can also be used for monitoring the progression of diseases that may be associated with the altered expression of signaling pathway polypeptides. The composition can also be used to purify a subpopulation of mRNAs, cDNAs, or genomic fragments in a sample. The expression profile continum pathology, e.g. AIDS, diabetes, pencreatitis, osteoporosis or ulcerative colitis, or a neuropathology, e.g. AIDS, diabetes, pencreatitis, osteoporosis or ulcerative colitis, or a neuropathology, e.g. dementia, amnesia, epilepsy, Alzheimer's disease or depression. This sequence represents a chiman polynucleotide probe of the invention. Note: The sequence data for this pathor.
                                                                                                                                                                                                               Human; probe; ss; receptor-like polypeptide; transducing polypeptide; effector-like polypeptide; cancer; immunopathology; neuropathology; drug development; toxicology; carcinogenicity; signalling pathway polypeptide; adrenal gland; bladder; bone; bone marrow; brain; breast; cerrix; tumour; immunopathology; diabetes; pancreatitis; osteoporosis; ulcerative colitis; neuropathology; dementia; amnesia; epilepsy; Alzheimer's disease; depression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New composition comprising polynucleotide probes, useful as array elements in a microarray for monitoring the expression of target polynucleotides or purifying a subpopulation of mRNAs, cDNA, or genomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 1659 BP; 519 A; 296 C; 385 G; 459 T; 0 U; 0 Other;

The DNA sequence encodes a 123 (Abeta40) or 129 (Abeta42) amino acid sequence, given in the specification. The DNA sequence is operably linked to a tissuether specific expression control sequence. Expression of the sequence gives the fly an altered phenotype. The purpose of the invention is for identifying agents that inhibit or promote the expression and/or function of genes or encoded polypeptides which modify the APP pathway. The agent
                                                                                                                                                                                                                                                                                                                                                                              Neuroprotective, nootropic, transgenic fly; Alzheimer's disease, Abeta, amyloid precursor protein; tissue-specific expression control; human APP; APP pathway modulator; gene therapy; gene; ds.

                                                       New transgenic fly, containing DNA encoding an Abeta portion of human APP, useful for identifying agents which modulate the APP pathway and which can be used to treat Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      "Protein of human homologue hCP35211"

is a compound, triple helix DNA, antisense oligonucleotide, double stranded RNA molecule, ribozyme, or particularly an antibody. It is used to treat conditions such as Alzheimer's disease. The agent can be used as an APP pathway modulator or in gene therapy. This polynucleotide sequence represents the DNA of the APP related human homologue hCP35211
                                                                                                                                                                                                                                                                                                                                                                                                                                886
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GCAAGAGCTGGATTTTATGCTTTAGGTGAAGGCGATAAAGTGAAGTGCTTCCACTGTGGA 120

genes (AAT70836-41) respectively code for a new class of mammalian proteins (AAW19581-86) that are inhibitors of apoptosis (IAP). The xiap gene (for X-linked IAP gene) was isolated from a human foetal brain ZapII cDNA library using an X-linked sequence tag site that shows strong homology with the conserved ring zinc finger domain of baculovirus CpIAP mucleic acids can be used to express IAP polypeptides in cells and animals to inhibit apoptosis, and as primers and probes to identify and isolate additional IAP genes, as well as in methods for treating diseases and disorders involving apoptosis (anti-apoptotic gene therapy)
                                                                                                                                                                                                                                                 ö

                  The present invention relates to antisense oligonucleotides designed to inhibit expression of the human X-linked inhibitor of apoptosis. The present sequence is the X-linked inhibitor of apoptosis DNA. Modified phosphorothicate 2'-methoxyethyl (2'-MOE) oligonucleotides are more effective inhibitors than unmodified oligonucleotides. The oligonucleotides may be used to inhibit X-linked inhibitor of apoptosis expression in cells and tissues in vitro. The oligonucleotides are also useful for treating animals or humans, prone to a disease associated with X-linked inhibitor of apoptosis. The oligonucleotides may also be used prophylactically to prevent infection, inflammation or tumour formation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; breast carcinoma; cancer; tumour; cytostatic; anti-tumour; gene;
                                                   The invention relates to an inhibitor of apoptosis (IAP) antisense nucleic acid (I) that inhibits IAP biological activity, regardless of length of the antisense nucleic acid, the IAP proteins may be mouse or human XIAP, HIAP1 or HIAP2. Also included are a pharmaceutical composition comprising a mammalian IAP antisense molecule and a method enhancing apoptosis in a cell, comprising administering a negative regulator of the IAP anti-apoptotic pathway to the cell. The IAP antisense inhibitor is useful for enhancing apoptosis in a cell in a mammal diagnosed with a proliferative disease. The method is useful for treating a patient diagnosed with a proliferative disease like cancer. The IAP antisense molecule is useful to treat, ameliorate, improve, sustain or prevent proliferative diseases (e.g. ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          886 gcaagagcrggarrrrargcrrraggrgaaggrgaraaagraaagrgcrrrcacrgrga

946 GGAGGGCTAACTGATTGGAAGCCCAGTGAAGACCCTTGGGAACAACATGCTAAATGGTAT 1005 Identifying a test compound that binds to a target RNA molecule by separating the detectably labeled target RNA:support-attached test compound complex from uncomplexed target RNA molecules and test compounds by flow cytometry. The invention relates to a novel method for identifying a test compound that binds to a target RNA molecule comprising separating the detectably labeled target RNA: support-attached test compound complex from uncomplexed target RNA molecules and test compounds. The separating process is carried out by flow cytometry and determining a structure of the type of test compound of the RNA: support-attached test compound complex by mass spectrometry. The method is useful for high-throughput screening of libraries of compounds to identify pharmaceutical leads. This polymucleotide sequence represents one of the target RNA motifs/ GCAAGAGCTGGATTTTATGCTTTAGGTGAAGGCGATAAAGTGAAGTGCTTCCACTGTGGA GGAGGGCTCACGGATTGGAAGCCAAGTGAAGACCCCTGGGACCAGCATGCTAAGTGCTAC 1 TATGAAGCACGGATCGTTACTTTTGGAACATGGATATACTCAGTTAACAAGGAGCAGCTT 826 TATGAAGCACGGATCTTTACTTTTGGGACATGGATATACTCAGTTAACAAGGAGCAGCTT 886 GCAAGAGCTGGATTTTATGCTTTAGGTGAAGGTGATAAAGTAAAGTGCTTTCACTGTGGA Gaps 0 Length 2540; Sequence 2540 BP; 781 A; 415 C; 571 G; 773 T; 0 U; 0 Other; 15; Indels 87.4%; Score 173; DB 8; 92.4%; Pred.
